This is a supplement to Vidovic and Khanna and includes additional sensitivity analyses. Additional models include: (1) an analysis of the effectiveness of program participation using toxicity weighted facility emissions instead of aggregate facility emissions, (2) pooled probit model of facility participation in the Program conditional on parent firm participation in the Program where a parent firm and a facility is removed from the dataset once it participates. This is again followed by an evaluation of determinants of facility emissions using GMM; (3) Determinants of facility participation in the Program and facility emissions while ignoring firm participation where we follow the approach by Bi and Khanna and estimate facility participation using pooled probit and facility emissions using a two-step feasible GMM estimator.

Table I: Descriptive statistics (1990): Firm level means and standard deviations (in parentheses)

Variable	All firms	Participants	Non-participants
Final good ^a	32.07	30.96	33.33
R&D/sales	0.02 (0.03)	0.03 (0.03)	0.02 (0.043)
Newness of assets	0.77 (0.97)	0.76 (0.10)	0.79 (0.88)
33/50 releases/sales (lbs/million \$)	734.7 (15935.7)	810.3 (18725.0)	650.0 (1209.1)
Weighted 33/50 releases/sales	291854.9 (1739433)	319762.9 (1917629)	260644.1 (1520699)

Note: *** indicates statistical significance at the 1% level, ** at the 5% level, and * at the 10% level.
 Robust standard errors clustered on firms with Windemeijer's finite sample correction are in parentheses.
 Dependent variable is the natural log of toxicity weighted 33/50 emissions. In all models the number of enforcements and inspections are predetermined. The number of observations reflects that our dataset starts in 1988 to allow for lags. Toxicity weighted 33/50 emissions and TRI emissions are measured in natural logs. All other variables are in levels.

Table V: Determinants of facility 33/50 emissions, 1991 – 1995 (endogenous TRI and HAP-TRI).

*This table corresponds to **Table 4** in the manuscript, but reports results assuming that TRI releases and the HAP to TRI ratio are endogenous and also using toxicity weighted emissions. These results are referred to in section 6.2 of the paper, *Facility 33/50 Emissions*.

Note: *** indicates statistical significance at the 1% level, ** at the 5% level, and * at the 10% level. Robust standard errors clustered on firms with Windemeijer's finite sample correction are in parentheses. Dependent variable is the natural log of aggregate 33/50 emissions in models 1-3 and the natural log of toxicity weighted 33/50 emissions in models 1W-3W. In all models the number of enforcements and inspections are predetermined and TRI and HAP-TRI are endogenous. The number of observations reflects that our dataset starts in 1988 to allow for lags. Aggregate and toxicity weighted 33/50 emissions and TRI emissions are measured in natural logs. All other variables are in levels.

Table VI: Determinants of facility participation in the 33/50 Program: Ignoring firm participation

*This table corresponds to **Table 5** in the manuscript, but reports results using toxicity weighted emissions.

Variable	Model 1W	Model 2W
First invitation group	-0.209 (0.144)	-0.095 (0.197)

Note: *** indicates statistical significance at the 1% level, ** at the 5% level, and * at the 10% level. Robust standard errors (facilities as cross sections) with Windemeijer's finite sample correction are in parentheses. Dependent variable is the natural log of toxicity weighted 33/50 emissions. In all models TRI and HAP-TRI ratio are treated as exogenous and the number of enforcements and inspections are

predetermined. Toxicity weighted 33/50 emissions and TRI emissions are measured in natural logs. All other variables are in levels.

SECTION 2: PARTICIPATION IS MODELED AS POOLED PROBIT INSTEAD OF RANDOM EFFECTS PROBIT

Table VIII: Determinants of facility participation in the Program, 1991-1995

*This table corresponds to **Table 3** in the manuscript. Participation is modeled as pooled probit model and a facility is removed from the dataset once it participates. Inverse Mills ratio calculated from firm level pooled probit model is included to correct for self-selection. Standard errors are bootstrapped.

Note: *** indicates statistical significance at the 1% level, ** at the 5% level, and * at the 10% level.

Robust standard errors clustered on firms with Windemeijer's finite sample correction are in parentheses.

In Models 1-3, the dependent variable is aggregate 33/50 emissions. In Models 1W-3W, the dependent variable is toxicity weighted 33/50 emissions.

SECTION 3: COMPARISON WITH BI AND KHANNA (2009)
Table X: Facility participation in the Program: Ignoring firm participation

*The models in this Table are not shown in the manuscript but discussed in section 6.3 *Sensitivity analysis*. We follow the approach by Bi and Khanna and estimate facility participation using pooled probit. For ease of comparison, the column labeled “Bi & Khanna” presents the results reported in Bi & Khanna (2009).

Variable	Bi&Khanna	Our data

	(0.151)	-
Constant	-4.612***	-2.242***
	(0.933)	(0.054)
AIC	20796.78	23190.47
% Correctly classified	90.36	91.05
Number of observations	35827	42915
Number of facilities	9028	8578
Log likelihood		-11575.2
Pseudo-R ²		0.104

Note: *** indicates statistical significance at the 1% level, ** at the 5% level, and * at the 10% level. Robust standard errors clustered on firms are in parentheses.

Table XI: Determinants of facility 33/50 emissions, 1991 – 1995: Ignoring firm participation

*The models in this Table are not shown in the manuscript but discussed in section 6.3 *Sensitivity analysis*. We follow the approach by Bi and Khanna and estimate facility emissions using a two-step feasible GMM estimator.
